NOAA WW3 and ww3-gpu Builds

Same

- Fortran physics: the fork is WW3-noaa plus the KOKKOS patch, checked by diff before --ww3 builds
- Lab switch (switch_lab_ompg by default), CMake Release, pinned pratico toolchain
- Every WW_KOKKOS_<PART> unset or 0 runs the Fortran routine in the ww3-gpu binary

Differs

- KOKKOS switch adds w3kokkosmd.F90 and #ifdef W3_KOKKOS branches at the call sites
- -DWW_KOKKOS=ON links libww_kokkos through bind(C) shims
- A flag set to 1 sends that part to Kokkos; WW_KOKKOS_ALL=1 sends every wired part

GPU

- CUDA backend only for --ww3-gpu; --ww3 --gpu is refused (exit 64)
- --gpu runs only after the owner types yes at a terminal (exit 7 otherwise)
- Device math: ww::libm copies of glibc with WW_KOKKOS_LIBM; device bits not yet compared on a GPU (unverified)
